DUALISM- THE WORLD OF THE PENUMBRA-Part 4

# The Emergence of Unknown Viruses

Part 2- (Last Part)

# Introduction

*Dear Readers,*

*As mentioned in previous articles, the era of Heisenberg's quantum worldview is gradually being replaced by the framework of* ***Integrated Sciences****.*

***Integrated Sciences*** *represent a unique development of Master Elahi's teachings, grounded in academic disciplines such as mathematics, physics, biology, genetics, and more.*

*This approach is capable of analyzing the structure of the universe, the nature and origin of beings, and the logic underlying creation in a scientific, rational, and comprehensible way—while also addressing the fundamental purpose of existence.*

*In this context, we have sought to support this claim through a series of multilingual articles published on the website of Andishe Online Germany (AOG), driven by the belief that a new era is emerging—one in which the foundations of thought on Earth are gradually shifting, paving the way for a new global order.*

*In this article, we attempt to analyze the origins of so-called emerging viruses. In future publications, following a discussion on the nature of the "true self" and a proper definition of the psyche, we will explore this topic in greater depth.*

# Disruption of the balance of power on Earth

On planet Earth, the balance of power is tilted toward positronic effects relative to the rest of the universe[1]. Nevertheless, a unique form of equilibrium exists between the two energy sources. From this point onward, the topic becomes somewhat complex and in order to understand this, readers should maintain their attention.

***" In every balanced biological system, a form of energetic equilibrium is maintained between light*** ***(the electronic field)*** ***and darkness*** ***(the positronic field).***

***If this balance is disturbed by external factors in favor of either the electronic or positronic source, entities from this or another realm are formed. It is outside the usual biological interactions, since this kind of appearance of microscopic beings depends a lot on the human way of life."***

### Definition of electronvolt eV:

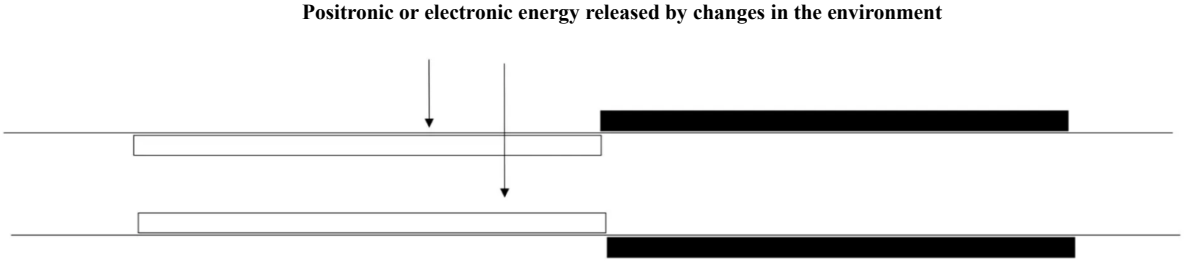
***" The energy gained by a particle with the electric charge of an electron when accelerated in a vacuum across a potential difference of one volt."***

In simple terms, the size of an electron volt corresponds to the energy of an electron at a tension of 1 volt:

**1eV= 1.602176634 x $10^{-19}$**

In order not to deviate from the academic sciences, we also use this mathematical-physical concept to explain the degree of energy difference between the two sources.

Consider the following graph:



If changes in the environment of a **system**[2] add up to one electronvolt to the energy level of one of the two sources, the equilibrium is disrupted in favor of that source. By disrupting the current equilibrium in this system, simple quantomagnetics quickly grow into very complex **macroquantomagnetics**[3]. As described in the article „**Emergence of Instinctive Features and Characters"**[4], a macroquantomagnet entity can manifest at two levels. To investigate these two levels, we need to analyse the matter a bit more deeply.

## Quantum formation of a macroquantomagnet

In the positronic world, the **attraction for gain**[5] stems from the influence of an antimacroquantomagnetic (a negative property). This is usually an attribute that determines the way the system interacts with the environment. For example, a scorpion stings and kills its prey under the influence of Profit Attraction. Under normal circumstances, this characteristic occurs only in behavior.

## Material origin of a macroquantomagnetism

If an external energy input of one electronvolt disrupts the balance in a certain system, so that the balance is disrupted in favor of the positronic source, this world can now create its own beings, for example harmful entities with biological inclinations opposing the world of light, i.e. human biological activities. Therefore, we are talking here about two different opposing forces, i.e. the profit-attraction and loss-rejection forces of the positronic world (negative source) and the electronic world (positive source).

We acknowledge that this topic is complex and not easy to understand, because many of the facts involved have to be explained, including, for example, how the balance between the two energy sources is disrupted, which factors are involved, and so on.

For this reason, and to ensure full clarity, we are examining the emergence of epidemic and pandemic diseases—as well as their underlying causes—through the lens of the principles of the **perfection process**[6]. Accordingly, we present the resulting conclusions.

## Historical epidemics **(and pandemics)**

For the moment, we will ignore traditional diseases and the frequency of their occurrence, as we will investigate this more closely in the future. Here, for specific reasons, we are dealing with diseases which arose at a particular time and have left millions of victims in their wake.

Let us first look at some of these diseases.

1. **The Black Death**[7] (1347–1350) with about 25 million victims.

2. A **smallpox**[8] epidemic among American Indians around 1518 claimed millions of lives. The disease was brought to the country by European immigrants.

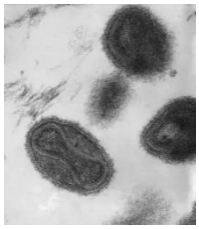
3. The **Spanish flu**[9] between March 1919 and June 1920 with between 50 and 100 million victims.

4. **AIDS**[10] began in the early 1980s and killed more than 30 million people by 2009.

5. **Ebola**[11], an African disease that killed tens of thousands of people in Sudan and Zaire in 1976.

6. The **coronavirus**[12] outbreak began in December 2019 in Wuhan, China. The pandemic was so **severe**[13] that it damaged China's relations with many countries around the world and caused thousands of deaths in a short period of time. As of the date of this article's preparation, the disease is still spreading very rapidly.

**Pockenvirus**

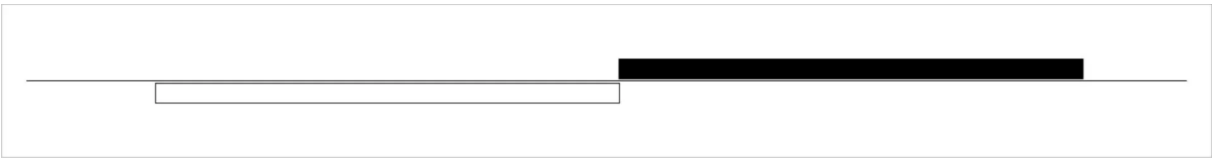


**Ebolavirus**

The appearance of all the above-mentioned types of viruses, which were unknown to scientists at that time, stems from an imbalance between the electronic and positronic realms.

At this point, it should be noted that the purpose of this article is not to examine the root cause of these diseases from a medical point of view, but rather to demonstrate scientifically the serious consequences when the relative balance between the two sources is disrupted in a negative direction, for example because of economic interests or other selfish and aggressive actions that lead to the destruction of the environment.

## The positronic energy predominates



Last week, I saw a documentary film on YouTube. It was about a very large poultry farm from a certain country (video)[14], especially in comparison to poultry farms in Germany. As can be seen in these pictures from the documentary, these chickens are in the dark and surrounded by chickens that have died from disease, where they cannot move because of their excessive density. Furthermore, these chickens are not allowed outside, which means that they are deprived of nature. They do not get the sunlight or fresh air they need. They are kept in very miserable conditions.

Most of these chickens are infected, which causes their feathers to fall off. Living in these conditions is clearly contrary to their natural requirements for these animals.

However, the process involves the body of this animal receives negative effects from the environment in the cage through the sensory organs and transmits them to the **soul**[15]. Since the information received in the soul is exclusively positronic energy, the balance in favor of the positronic source is disrupted. As a result, the animal's immune system is weakened and parasites, which are positronic entities, are created in the body by an increase in dark energy.

To alleviate this problem, poultry farmers feed chickens with antiparasitic agents. While this helps prevent the formation of parasites, it increases psychological stress in the animals. Moreover, the associated positronic effects are transferred to their eggs and meat, where they persist.

As far as we humans are concerned, It is evident that by consuming these eggs or the meat, these positronic effects are transferred into the human blood, where, together with other negative effects that have entered the human bloodstream in a similar form, they produce positronic organisms at a certain point in time. Among other effects are the above-mentioned viruses.

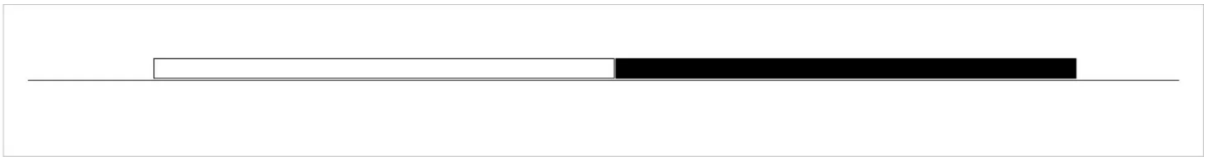
**Fact A + Fact D + Fact F + Fact J = New virus**

What has actually happened is nothing other than the disturbance of the balance between the two sources, caused by humans themselves in favor of the positronic source, which gives the positronic world the opportunity to create its own being, in this case a new virus. Because these effects are not transmissible to one person or a specific group, but to a large number of people, the disease becomes an epidemic or even pandemic.

These two opposing worlds all over the universe are trying to get information from the opposite world, so as soon as we humans succeeded in producing a medicine against a virus, it becomes known to the positronic realm and the necessary information is stored in a special database. As a result, as soon as this world is dominant again, a new bio-organism (virus) will be created which is more advanced or at least different from the previous one. This topic is thoroughly analyzed in the 'Integrated Sciences' section.

It should be noted that it is not only one factor that can cause such diseases: A number of such causes must be linked together in order to acquire sufficient power and knowledge to create such beings.

# Relative balance between energy sources



Everywhere in the human body, there are numerous microbiomes. If there are no interfering factors between the two energy sources, many of these microscopic creatures are beneficial and continue to function according to their instinctive roles as defined by the "**Fundamental Principles of Creation"**[16].

This means that under normal conditions, the natural biological life of these organisms functions in the direction of the health of the biological bodies of humans, animals, and even plants.

If one day science can stabilize this balance, diseases could theoretically be eradicated, though this currently seems implausible. However, this relative balance also prevents these organisms from

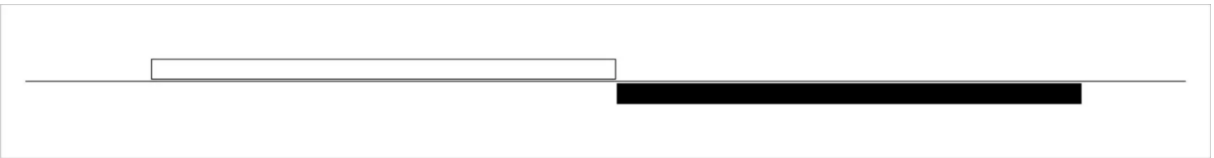
becoming malignant. But if this is the case, the electronic entities within the system can restore the conditions to their original state with the available amount of electronic energy.

We acknowledge that the following perspective may not be to the taste of some doctors, but scientists who have been working in the laboratory for many years support the theory:

***"Due to the relative balance maintained in the biological body between the two sources, diseases not of genetic origin or caused by accidents are treated naturally by the body itself.***

***Medications do not make the situation worse, they rarely provide healing without side effects."***

## Electronic energy is dominant



If the balance between energy sources is disrupted in favor of electronic energy, light beings with special positive characteristics (from a human point of view) are created. A concrete example is the famous cashmere wool from goats that live at the foot of the Himalayas. Some studies show that this type of wool not only has a very delicate, very stable, light and soft texture, but also has positive effects on heart function. It is generally believed that cashmere fabrics are of unparalleled quality and that wearing them creates a satisfying feeling in people.

According to our research at the University of Perfection, these effects, which are not yet publicly known, are due to the special spiritual condition of the Himalayas, which has also had an impact on the climate and ecosystem of the region. These electronic effects have shifted the balance between the two energy sources in favor of electronic energy and have created many useful properties.

The second example is the Gangas or Gangas, which is heavily polluted in the middle and lower river reaches, especially near large Indian cities. However, **according to studies by some world-renowned researchers**[17], the presence of a powerful antivirus in these waters is certain.

The mere fact that millions of Indians bathe in the Ganga every year and, according to the reports of some famous Indian mystics, rarely fall ill during this bathing suggests that the disruption of the balance between the two sources—due to spiritual influences—increases electronic energy and thus produces light beings. One of the reasons for the disruption of these two energy sources in favor of electronic energy is the attention of millions of people to the origin of creation, which causes this

positive energy source to become dominant. In this state, it can create its own microscopic organisms—namely, antibacterials and germicides. Some of these biological organisms may not yet be known to current biological science.

# Ultimate Conclusion

***... [After internally boiling ], when he regained consciousness, wherever he looked, there was only darkness.***

***In this darkness that Was called Primordial darkness, he saw a beam of light that split the darkness like a sunbeam. .....***

***... The light beam reflected from Mahiaat, and was the only thing that could be seen in the dark. The spiritual space in which Mahiaat moved consisted of light. Light cannot be detected in the light, but in the dark. For this reason, light and darkness must face each other everywhere and in every respect*. [The fourth and fifth paragraph][18]**

In all the multiverses, there are two kinds of energy sources. By accumulating an energy mass with a high percentage of positronic effects, even from one electronvolt upwards in a particular biological system, for example the human body, a number of positronic Antiquantomagnetics (Antiqantomagnets) are first generated, and as the positronic energy entering the system increases, the beings of this world, for example various viruses, are created.

In the opposite direction, as discussed above, we will have electronic beings.

**In non-technical language:**

Everything humans consider evil or bad produces a dark energy when its potential is converted into power. When a mass of light energy encounters it, this energy is either neutralized or its frequency is reduced so that it remains in the system as a pure property.

When this force collides with another mass of positronic force, its properties are intensified, and this causes the production of a multitude of primitive dark creatures. This is also true in the opposite direction for electronic or light forces.

In the universe, however, it is important to determine whether the energy is electronic or positronic when talking about energy.

This fact is not yet known to scientists and therefore, they do not take into account the eternal sources of these energies in all mathematical and physical calculations and considerations.

Of course, in mathematics or Newtonian physics, there is no need to determine the primary source of energy, as in quantum mechanics this has not yet been investigated.

***"Today, we have entered a new field of science, which we have called "Integrated Sciences."[19] This science, which reflects the teachings of Ostad Elahi, is capable of ending the Heisenberg quantum era—or at least correcting such considerations. Therefore, in all fields of Integrated Sciences, it is necessary first to determine whether the magnetic field in question is positronic or electronic in nature, originating from one of the two energy sources discussed above. "***

In this respect, it should not be forgotten that the two sources are constantly trying to obtain information from each other, as the survival of each is always threatened by the other. Therefore, as soon as a type of virus is detected by the human body, the information about it is stored in the database in the soul. According to this data, the (Basharic) soul will send the necessary instructions through the quantum cord to the thalamus, which will be used to prepare a medicine and a natural vaccine in the body.

On the other hand, the positronic world is immediately informed that this virus is identified by the light element of the body, for example, the leukocytes. Therefore, the positronic entities design another organism, but this remains only a draft, since a certain amount of positronic energy is needed to produce a new virus according to this draft. This energy is only provided to the dark world after the disturbance in the balance between the two energy sources in the body, as explained above. Thus, each time a new microscopic positronic organism, with properties unknown to the human body, is created.

What was explained above in simple terms is the main reason for the appearance of new viruses that appear from time to time and claim victims.

The duration of the epidemic activity of an emerging virus and its destructive power depend entirely on the amount of positronic energy released.

If, for example, millions of electronvolts of energy, referred to here as positronvolts, are released as a result of a disruption of the relative imbalance between two energy sources in favor of one positronic energy source, viruses produced from this energy demand sacrifices until the level of this negative energy is minimised.

In this context, the problem lies in the fact that such a virus, once produced in its proper environment—for example, within a host body—is then transmitted from one individual to another.

As soon as the positronic energy level drops, the severity of the epidemic decreases and the virus gradually disappears. This occurs because the body itself has discovered the solution and applied it against the virus—while the medical world believes it has brought the disease under control.

In the case of the coronavirus, the medical community has announced that there is currently no definitive cure for the disease (This example was composed during the peak of the COVID-19 pandemic.). The drugs and medical guidelines available to manage the virus remain quite limited.

However, the general and highly important conclusion drawn from the insights of *Integrated Sciences* is this:

There are two types of energy in the universe. One is electronic energy, the smallest unit of which is represented by one electronvolt:

**1 eV = 1.602176634 × $10^{-19}$**

Similarly, there exists positronic energy, which must be denoted by the positronvolt:

**1 pV = 1.602176634 × $10^{-19}$**

***"What has been briefly and concisely presented in this two-part article on the emergence of unknown viruses is merely a small indication of the significance of Integrated Sciences, which opens the door to a new world with a vastly expanded horizon."***

It is only within this new paradigm that we can truly promise Albert Einstein:

***"Ostad Elahi's Integrated Sciences do not simply lead us toward the Elder (God); they offer profound insight into the underlying principles of being and consciousness."*** [20]

[17] Several environmental microbiology studies published in peer-reviewed journals have demonstrated the presence and abundance of phages (bacteriophages) in the water of the Ganga River; for example:

Sen و Saha (2013) - «Isolation and Characterization of Bacteriophages from the River Ganges» in Indian Journal of Virology

The minimum concentration found in samples was approximately 1,000,000 phages per milliliter, while the maximum concentration reached about 100,000,000 phages per milliliter. In other words, depending on the sampling location and time, between one million and one hundred million bacteriophages can be found in each milliliter of Ganga River water.

Dubey et al. (2006), in their article titled "Occurrence of Bacteriophages in Natural Water Bodies of India and Their Potential in Phage Therapy" published in the *International Journal of Environmental Microbiology*, conducted an extensive study of river water samples, including those from the Ganga River. They confirmed that these phages possess antibacterial properties against pathogenic species such as *Escherichia coli* and *Vibrio cholerae*.
